

# Requirements

To implement this project you need:

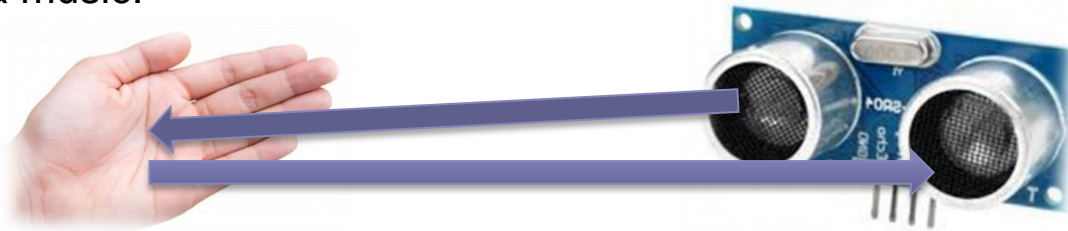

1. Arduino controller (simplest Nano or any other type)
2. Ultrasonic sensor HS-SR04
3. Some set of standard Arduino wires and proper USB cable
4. PC with Windows installed. OS X or Linux also suitable, but these OS require different software and drivers.

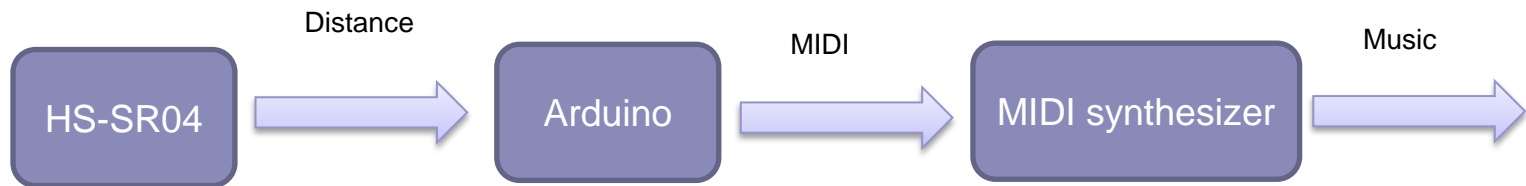

# Project concept

The [HC-SR04](#) ultrasonic sensor uses sonar to determine distance to an object.

Using own hand or any other kind of obstacle we can get digital information that can be used to generate a music.

The distance information after properly processing will be sent to MIDI synthesizer software running on PC.

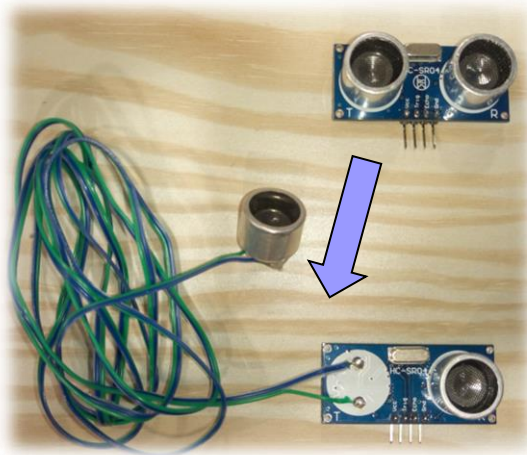

MIDI synthesizer will generate audio stream using MIDI messages from Arduino (including note pitches, velocity, etc) so music will be played by PC audio system.

# Sensor rework

To play you can use standard HS-SR04 sensor without any changes.

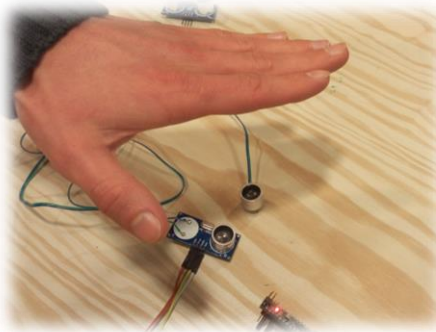

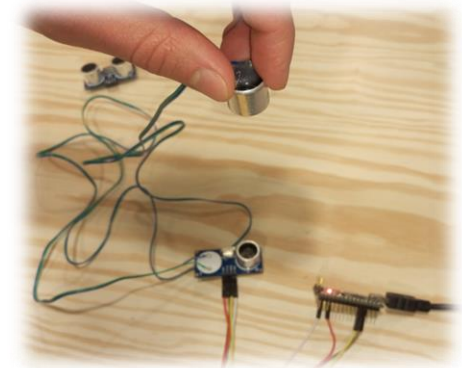

But the best performance and accuracy can be achieved if direct ultrasonic link will be used between US transmitters and receiver instead of echo back signal.

So if you want to get high efficiency of playing you should to unsold transmitter and use two wires to connect it to PCBA.

In this case you should change the position of transceiver holding it in your hands to change the distance to source of ultrasonic sound.

But, in any way, you can still use echo back to play, just put the both transmitter and receiver under your hand.

# Assembling and programming

All requirement wiring documentations (it's very simple!!) and Arduino code sketch you can find in repository <https://github.com/rnd64/ToySon>

Sketch uses MIDI library from [FortySevenEffects](#), so install this library before start compiling of sketch using Arduino Library manager or from sources: [https://github.com/FortySevenEffects/arduino\\_midi\\_library](https://github.com/FortySevenEffects/arduino_midi_library)

Pay your attention that Sketch has some defines that will help you to tuning Arduino software to match your imagination.

For example, you can change music note range to achieve your own music preferences.

Please, see the definition section in .INO sketch file.

After downloading of program just configure PC software to grub of MIDI stream from Arduino as described below.

```

1 /*
2  * Simple ultrasonic MIDI controller
3  * Version 0.1
4  * http://EnD64.com, 2016
5  */
6
7 //
8 // Set MIDI_ENABLED to generate MIDI output instead of Serial debug messages
9 // This program uses hardware Serial port as output MIDI (115200, 8, n, 1)
10 // See for reference HS-SR04 http://www.micropik.com/PDF/HCSR04.pdf
11
12 #define MIDI_ENABLED 1
13
14 #if (MIDI_ENABLED)
15   #include <MIDI.h>
16 #endif
17
18 //
19 // Global constants and parameters
20 //
21
22 const byte echoPin = 8; // Digital input pin to received echo from HS-SR04
23 const byte trigPin = 9; // Digital output pin to set trigger signal to HS-SR04
24 const byte TRIG_DURATION = 10; // usec, duration of control trigger signal in accordingly with HS-SR04
25 const int ECHO_TIMEOUT = 8000; // usec, timeout to wait of echo back pulse
26 const unsigned int MIN_ECHO_DURATION = 200; // echo from closer objects will be ignored
27 const unsigned int MAX_ECHO_DURATION = 2200; // echo from more far objects will be ignored. In general
28 const byte MEASUREMENT_COUNT = 10; // count of echo probes for each position to encrease accuracy of
29
30 //
31 // MIDI parameters and configuration
32 //
33
34 #if (MIDI_ENABLED)
35   MIDI_CREATE_DEFAULT_INSTANCE();
36   const byte MIDI_CHANNEL = 1; // MIDI channel to send all notes to PC
37   const byte MAX_MIDI_VELOCITY = 127; // Default velocity (loudness) for notes pitch
38 #endif
39 const unsigned int LOW_NOTE = 44; // Lowest note pitch to generate, 64 = E3 (1 guitar open string),
40 const unsigned int HIGH_NOTE = 64*12; // Highest note pitch to generate, first string, 12th guitar fret
41 const unsigned long MIN_NOTE_INTERVAL = 5000; //usec, minimum interval between two notes following each other

```

# PC software setup

To provide compatibility with all Arduino controllers this project uses MIDI over Serial transport. So, some middleware is required to grab MIDI messages from Serial stream and translate them to MIDI interface.

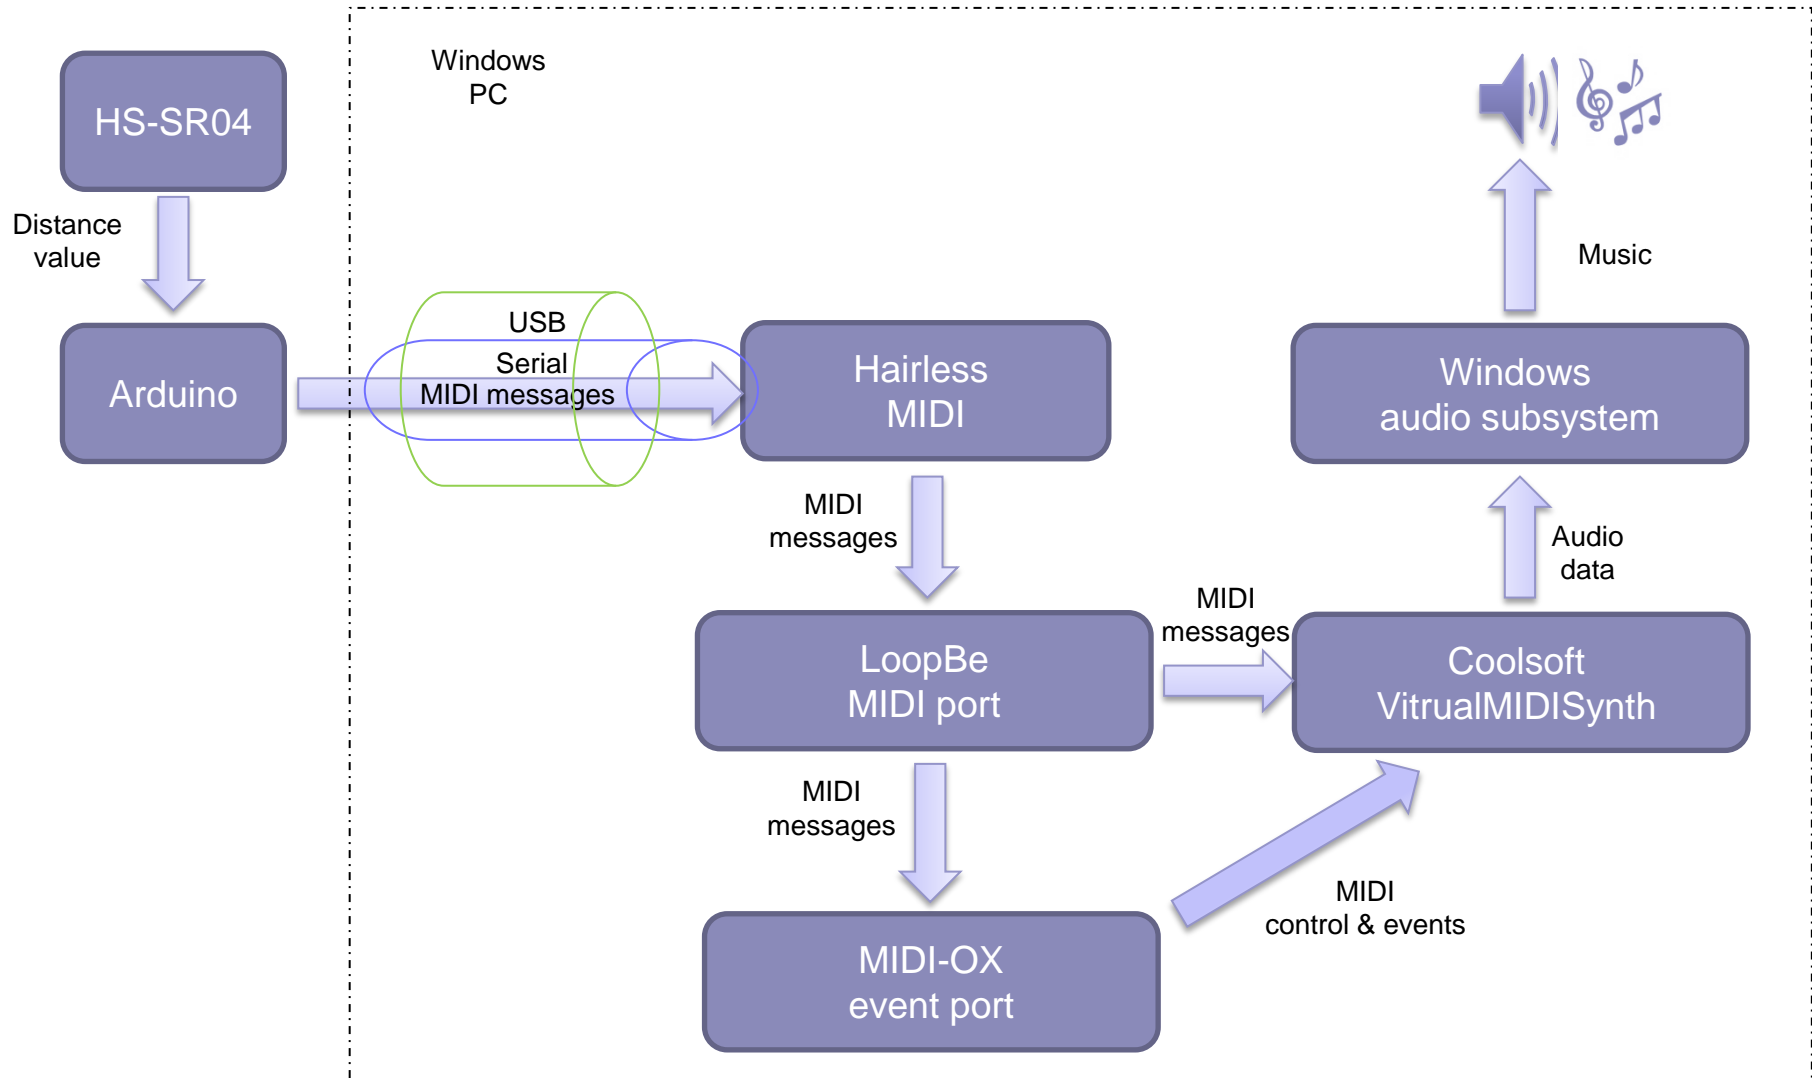

To achieve these targets you need use some additional software:

1. Hairless MIDI<->Serial Bridge <http://projectgus.github.io/hairless-midiserial/>
2. LoopBe1 MIDI driver <http://nerds.de/en/loopbe1.html>
3. Any suitable MIDI synthesizer. You can use built-in Microsoft GS Wavetable Synth or you can install Coolsoft VirtualMIDISynth <http://coolsoft.altervista.org/en/virtualmidisynth> Also you need for any suitable Soundfonts file <http://coolsoft.altervista.org/en/virtualmidisynth#soundfonts>

In addition, we recommend use MIDI-OX tool <http://www.midiox.com/> to easy visual configure, setup and monitoring MIDI devices, instrument selection, etc.

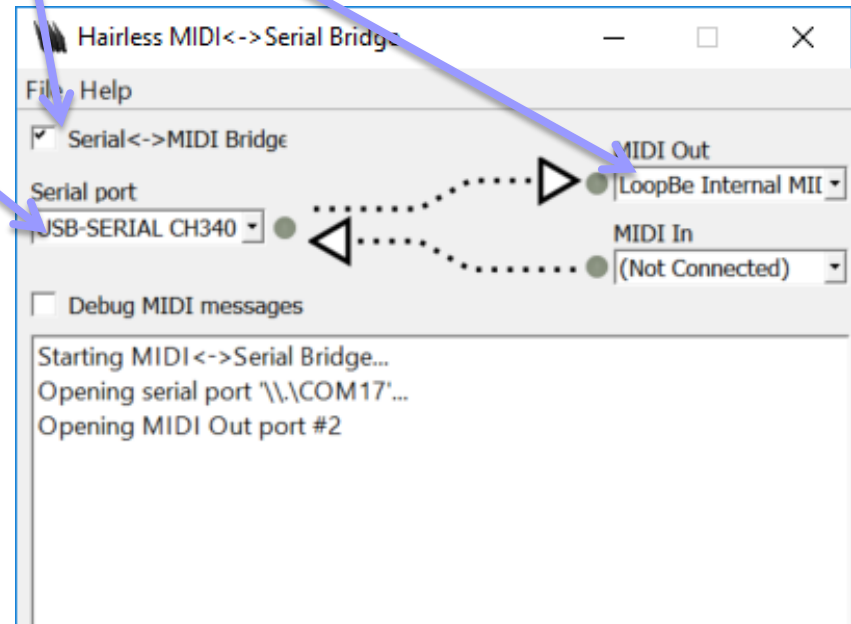

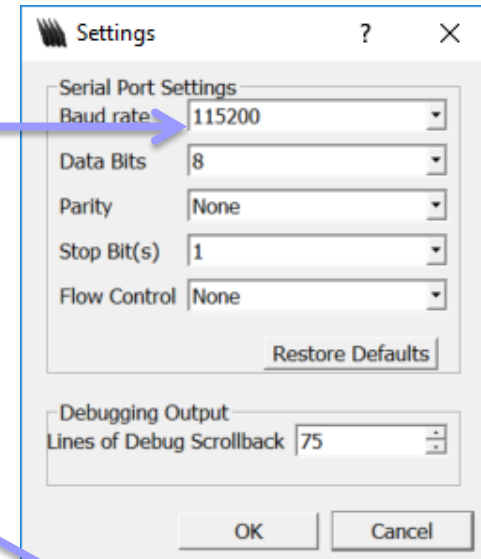

# PC software setup

So, the environment to play showed below:

# Tips: Hairless MIDI Bridge

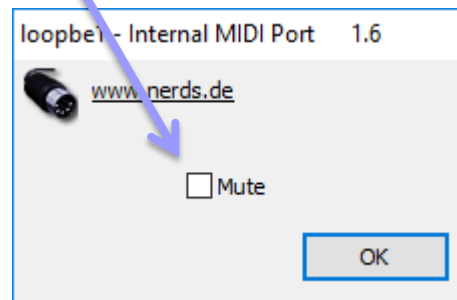

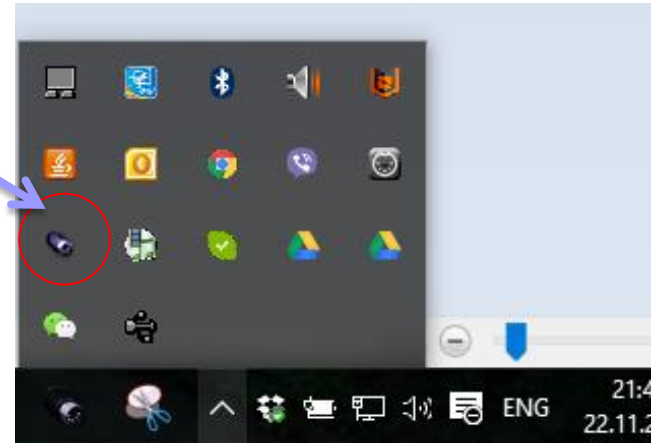

1. Set correct COM-port speed in preferences
2. Don't forget switch-off before and switch-on bridge after Arduino code uploading
3. Select proper input COM-port for connected Arduino
4. Choose Loopbe Internal MIDI port as output
5. Input is not required in this project

# Tips: LoopBe Internal MIDI port

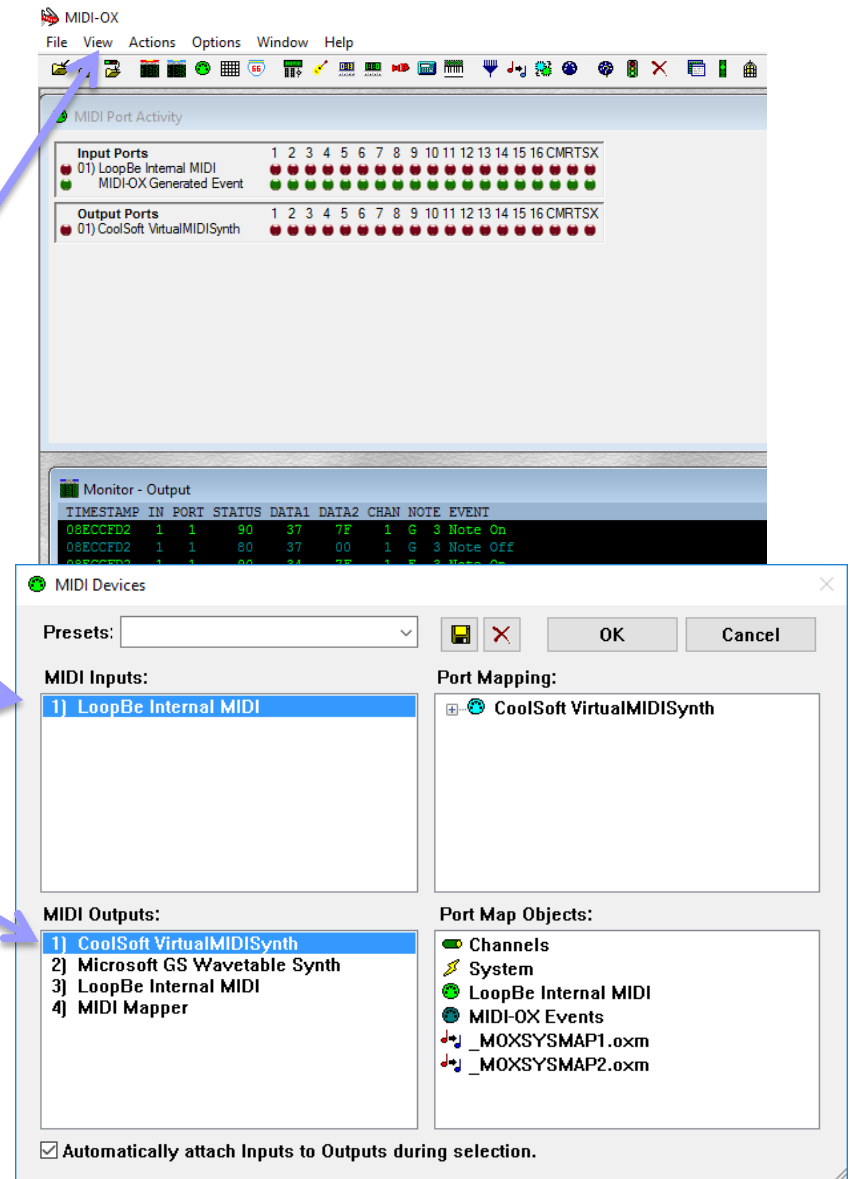

1. Be sure that Internal loopback port is not muted during testing

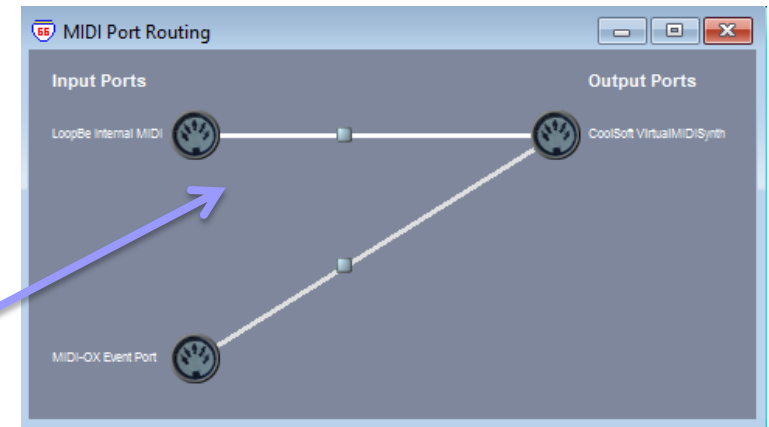

# Tips: MIDI-OX

1. Use “Options->Midi devices..” to select proper input and Output devices to attach

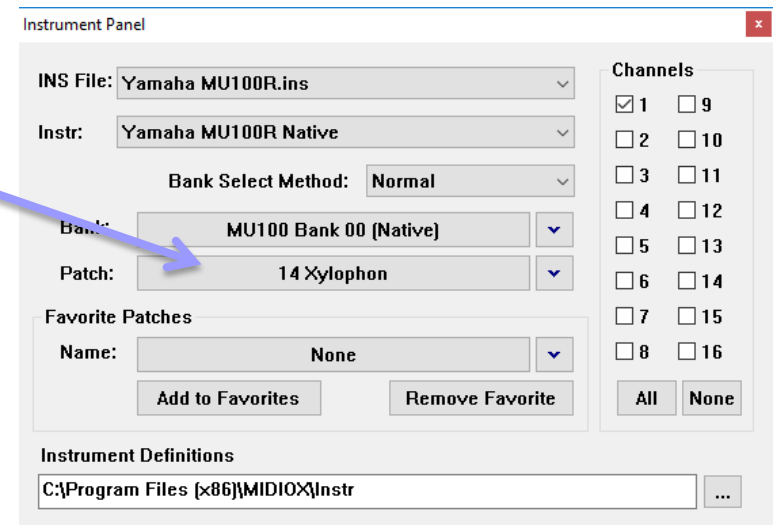

# Tips: MIDI-OX

2. Use “View->Port routings” to check and define proper connectivity of input and output MIDI devices as showed on the right picture

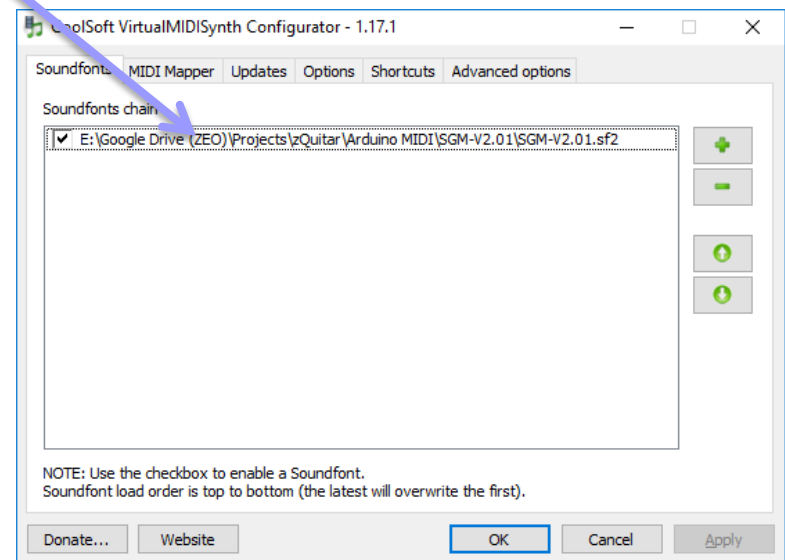

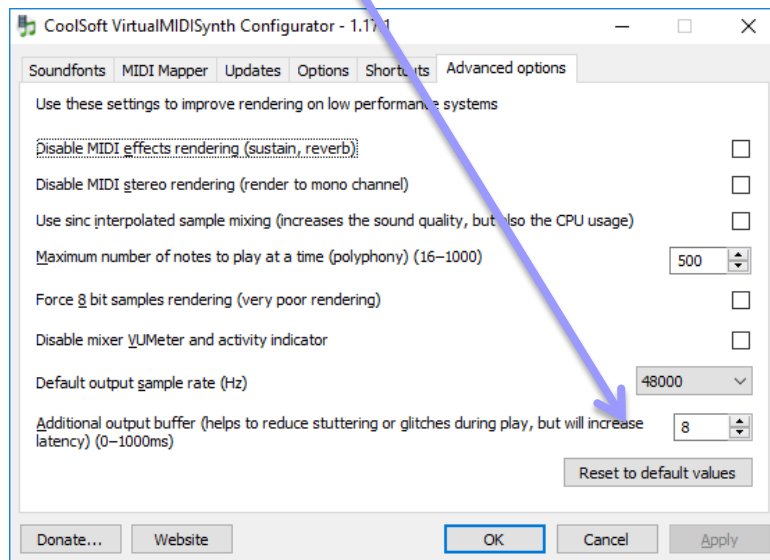

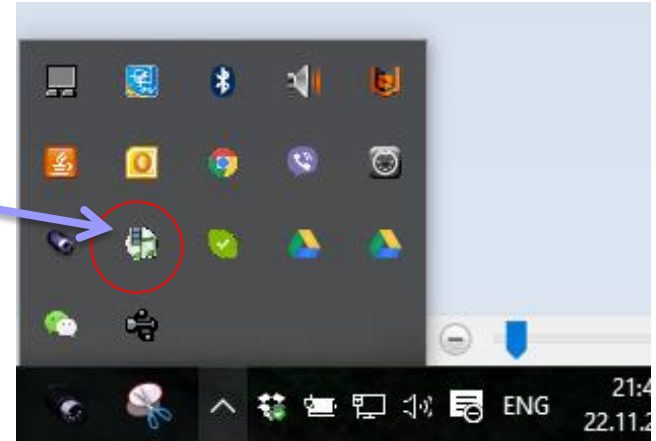

3. Use “View->Instrument panel..” to manage music instruments you want to play

# Tips: CoolSoft VirtualMIDISynth

1. Add wanted Soundfonts file
2. Configure buffers to optimal delays and sound quality

Enjoy!
